

DNA (Ch. 12)

Brief History

- Many people contributed to our understanding of DNA
 - T.H. Morgan (1908)
 - Frederick Griffith (1928)
 - Avery, McCarty & MacLeod (1944)
 - Erwin Chargaff (1947)
 - Hershey & Chase (1952)
 - Watson & Crick (1953)
 - Meselson & Stahl (1958)

1908 | 1933

Chromosomes related to phenotype

- T.H. Morgan
 - working with *Drosophila*
 - associated phenotype with specific chromosome
 - white-eyed male had specific X chromosome

Genes are on chromosomes 1908 | 1933

- Morgan's conclusions
 - genes are on chromosomes
 - but is it the protein or the DNA of the chromosomes that are the genes?
 - initially proteins were thought to be genetic material...
Why?

What's so impressive about proteins?!

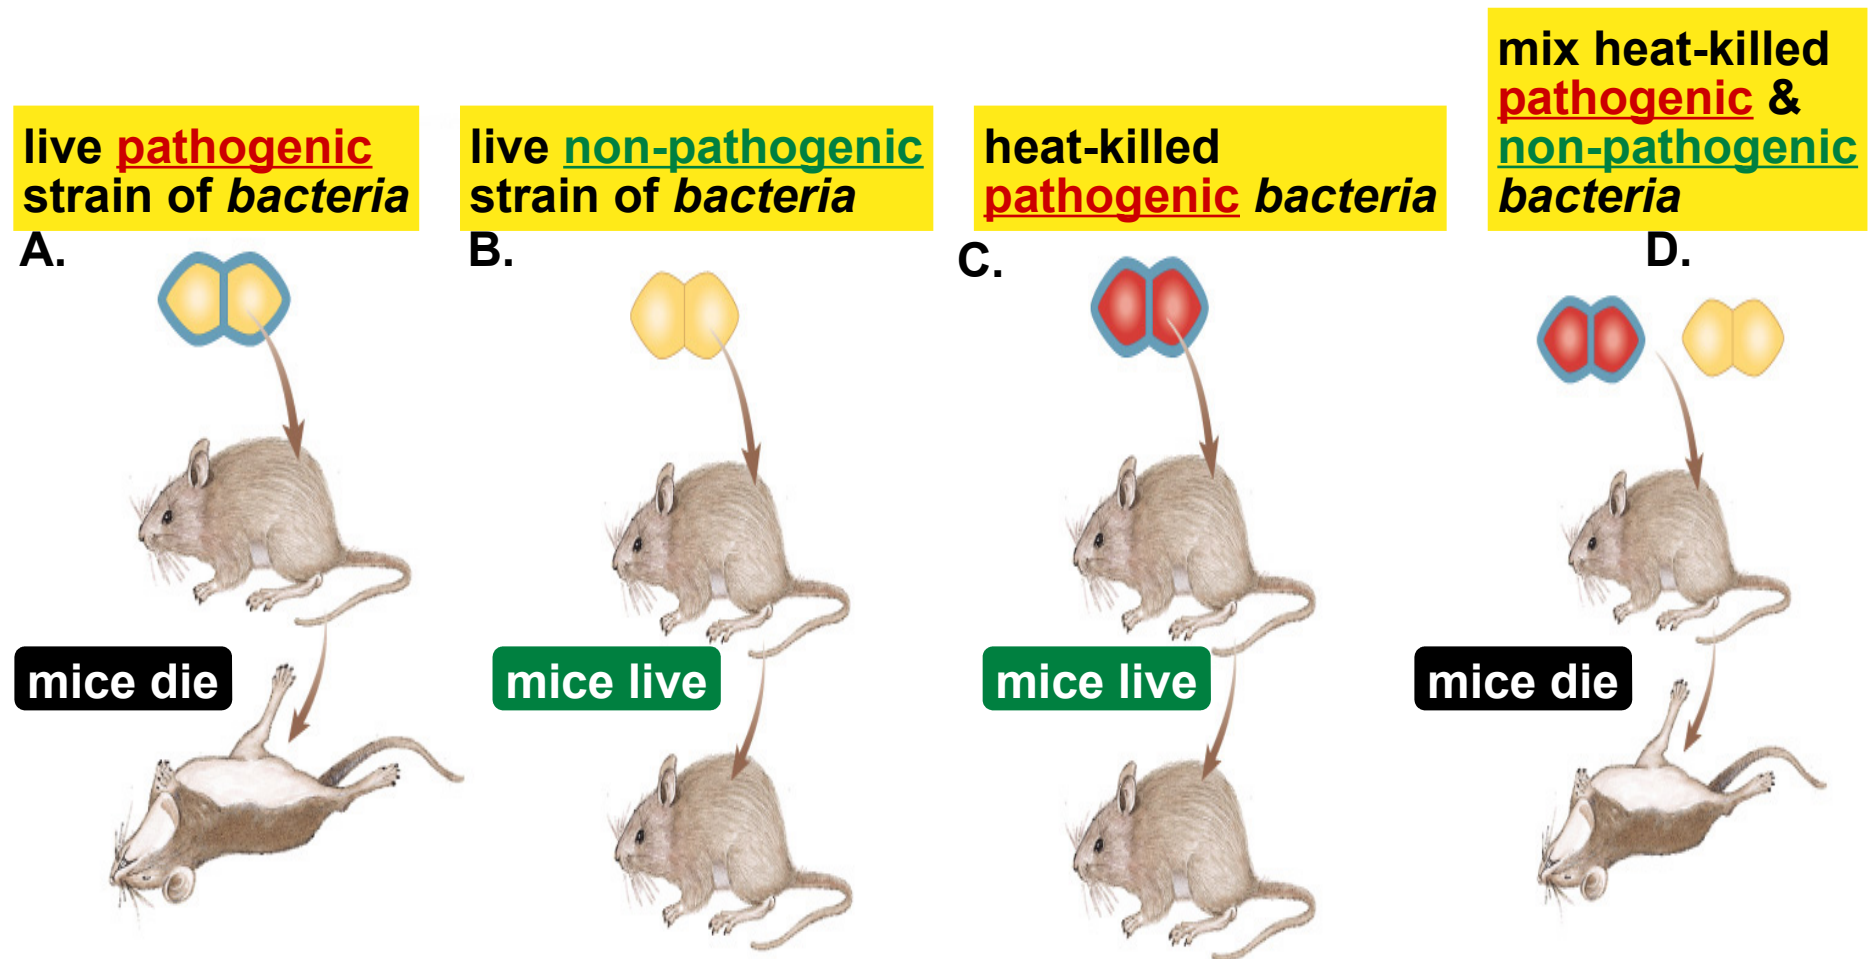

The “Transforming Principle”

1928

- Frederick Griffith
 - *Streptococcus pneumonia* bacteria
 - harmless live bacteria (“rough”) mixed with heat-killed pathogenic bacteria (“smooth”) causes fatal disease in mice
 - a substance passed from dead bacteria to live bacteria
 - “Transforming Principle”

The “Transforming Principle”

Transformation = change in phenotype
something in heat-killed bacteria could still transmit disease-causing properties

DNA is the “Transforming Principle” 1944

- Avery, McCarty & MacLeod
 - Purified DNA & proteins from *Streptococcus pneumonia* bacteria
 - injected protein into bacteria
 - no effect
 - injected DNA into bacteria
 - transformed harmless bacteria into virulent bacteria

What's the
conclusion?

Avery, McCarty & MacLeod 1944 | ???!!

- Conclusion
 - first experimental evidence that DNA was the genetic material

Oswald Avery

Maclyn McCarty

Colin MacLeod

Confirmation of DNA

1952 | 1969
Hershey

- Hershey & Chase
 - classic “blender” experiment
 - worked with bacteriophage
 - viruses that infect bacteria
 - grew phages in 2 media, radioactively labeled with either
 - ^{35}S in their proteins
 - ^{32}P in their DNA
 - infected bacteria phages

Why use
Sulfur
vs.
Phosphorus?

Hershey & Chase

Protein coat labeled with ^{35}S

T2 bacteriophages are labeled with radioactive isotopes
S vs. P

DNA labeled with ^{32}P

bacteriophages infect bacterial cells

bacterial cells are agitated to remove viral protein coats

^{35}S radioactivity found in the medium

^{32}P radioactivity found in the bacterial cells

Which radioactive marker is found inside the cell?

Which molecule carries viral genetic info?

Blender experiment

- Radioactive phage & bacteria in blender
 - ^{35}S phage
 - radioactive proteins stayed in supernatant
 - therefore viral protein did NOT enter bacteria
 - ^{32}P phage
 - radioactive DNA stayed in pellet
 - therefore viral DNA did enter bacteria
 - Confirmed DNA is “transforming factor”

Taaa-Daaa!

Hershey & Chase

1952 | **1969**
Hershey

Martha Chase

Alfred Hershey

Erwin Chargaff

1947

- DNA composition: “Chargaff’s rules”
 - varies from species to species
 - all 4 bases not in equal quantity
 - bases present in characteristic ratio
 - humans:

Erwin Chargaff

= 30.9%

= 29.4%

= 19.9%

= 19.8%

Rules

A = T

C = G

That's interesting!
What do you notice?

Structure of DNA

1953 | 1962

- Watson & Crick
 - developed double helix model of DNA
- other leading scientists working on question:
 - Rosalind Franklin
 - Maurice Wilkins
 - Linus Pauling

Watson and Crick

[1953 article in Nature](#)

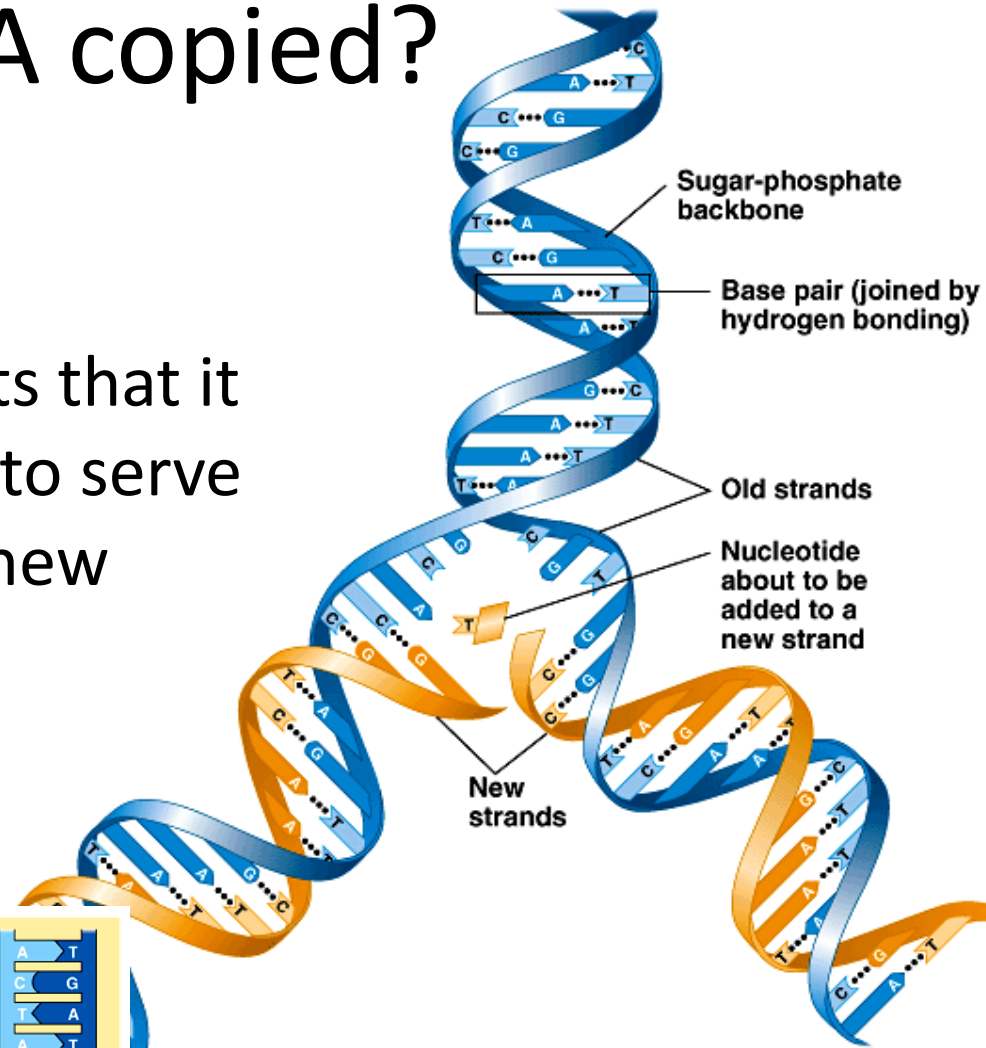

Rosalind Franklin (1920-1958)

But how is DNA copied?

- Replication of DNA
 - base pairing suggests that it will allow each side to serve as a template for a new strand

“It has not escaped our notice that the specific pairing we have postulated immediately suggests a possible copying mechanism for the genetic material.”

— Watson & Crick

Models of DNA Replication

Can you design a nifty experiment to verify?

conservative

semiconservative

dispersive

P

1

2

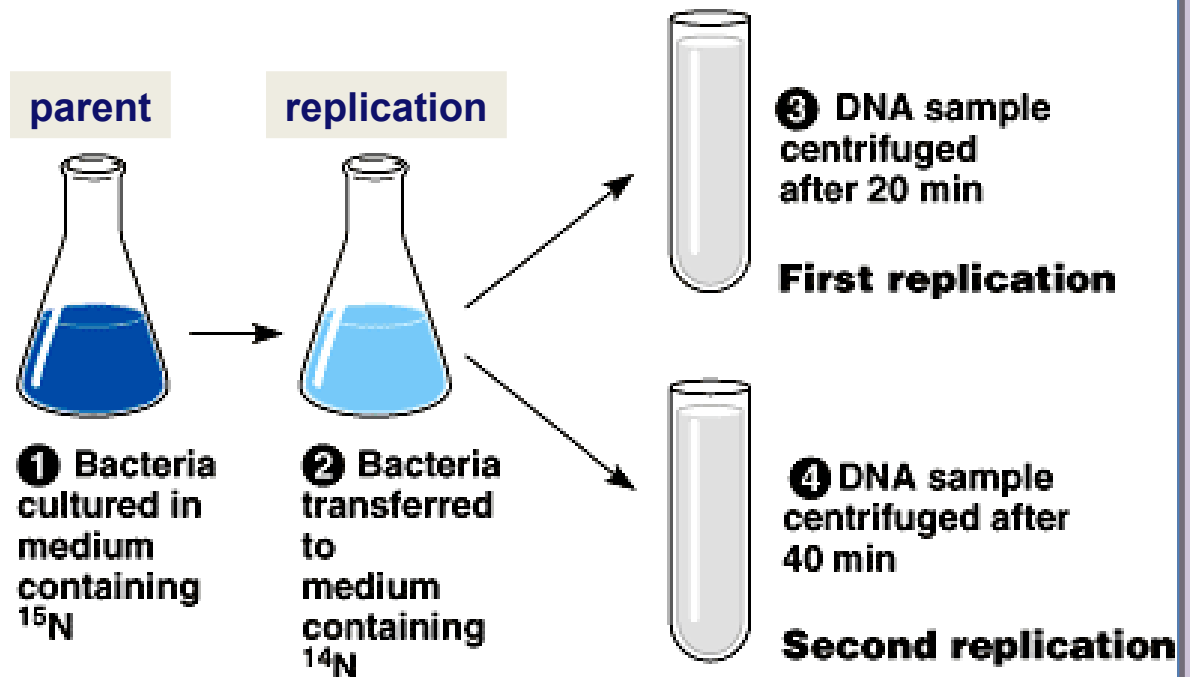

Semiconservative replication

1958

- Meselson & Stahl
 - label “parent” nucleotides in DNA strands with heavy nitrogen = ^{15}N
 - label new nucleotides with lighter isotope = ^{14}N

"The Most Beautiful Experiment in Biology"

Predictions

1st round of replication

conservative

semi-conservative

dispersive

2nd round of replication

conservative

semi-conservative

dispersive

Meselson & Stahl

Scientific History

- March to understanding that DNA is the genetic material
 - T.H. Morgan (1908): genes are on chromosomes
 - Frederick Griffith (1928): a transforming factor can change phenotype
 - Avery, McCarty & MacLeod (1944): transforming factor is DNA
 - Erwin Chargaff (1947): Chargaff rules: A = T, C = G
 - Hershey & Chase (1952): confirmation that DNA is genetic material
 - Watson & Crick (1953): determined double helix structure of DNA
 - Meselson & Stahl (1958): semi-conservative replication

The “Central Dogma”

- Flow of genetic information in a cell

Science Fun
Party Time!
Any Questions??

Courtesy of Dr. M. Meselson, Harvard University.

Review Questions

1. Tobacco mosaic virus has RNA rather than DNA as its genetic material. In a hypothetical situation where RNA from a tobacco mosaic virus is mixed with proteins from a related DNA virus, the result could be a hybrid virus. If that virus were to infect a cell and reproduce, what would the resulting "offspring" viruses be like?
 - A. tobacco mosaic virus
 - B. the related DNA virus
 - C. a hybrid: tobacco mosaic virus RNA and protein from the DNA virus
 - D. a hybrid: tobacco mosaic virus protein and nucleic acid from the DNA virus
 - E. a virus with a double helix made up of one strand of DNA complementary to a strand of RNA surrounded by viral protein

2. Cytosine makes up 38% of the nucleotides in a sample of DNA from an organism. What percent of the nucleotides in this sample will be thymine?
- A. 12
 - B. 24
 - C. 31
 - D. 38
 - E. It cannot be determined from the information provided.

3. In an analysis of the nucleotide composition of DNA, which of the following is *true*?

A. $A = C$

B. $A = G$ and $C = T$

C. $A + C = G + T$

D. $A + T = G + C$

E. Both B and C are true

4. A space probe returns with a culture of a microorganism found on a distant planet. Analysis shows that it is a carbon-based life form that has DNA. You grow the cells in ^{15}N medium for several generations and then transfer it to ^{14}N medium. Which pattern in this figure would you expect if the DNA were replicated in a conservative manner?

5. In analyzing the number of different bases in a DNA sample, which result would be consistent with the base-pairing rules?

A. $A = G$

B. $A + G = C + T$

C. $A + T = G + T$

D. $A = C$

E. $G = T$

6. Imagine the following experiment is done: Bacteria are first grown for several generations in a medium containing the *lighter* isotope of nitrogen, ^{14}N , then switched into a medium containing ^{15}N . The rest of the experiment is identical to the Meselson and Stahl experiment. Which of the following represents the band positions you would expect after two generations? *

Bands after one replication on ^{14}N
